

Ixazomib, Lenalidomide and Dexamethasone Therapy - 28 day

INDICATIONS FOR USE:

| INDICATION | ICD10 | Regimen Code | Reimbursement Status * |
|--|-------|--------------|------------------------|
| Ixazomib in combination with lenalidomide and dexamethasone for the treatment of adult patients with multiple myeloma who have received at least one prior therapy | C90 | 00516a | CDS 1/12/2018 |

*If the reimbursement status is not defined, the indication has yet to be assessed through the formal HSE reimbursement process.

TREATMENT:

The starting dose of the drugs detailed below may be adjusted downward by the prescribing clinician, using their independent medical judgement, to consider each patient's individual clinical circumstances.

Ixazomib is administered once weekly on Days 1, 8, and 15, dexamethasone on Days 1, 8, 15, and 22 and lenalidomide on Day 1- 21 in a 28-day treatment cycle (Table 1).

Treatment should be continued until disease progression or unacceptable toxicity. Treatment for longer than 24 cycles should be based on an individual benefit risk assessment, as the data on the tolerability and toxicity beyond 24 cycles are limited.

Table 1: Treatment table for ixazomib

| Day | Drug | Dose | Route of administration | Cycle |
|----------------|---------------|------|-------------------------|---------------|
| 1, 8 and 15 | Ixazomib | 4mg | PO ^a | Every 28 days |
| 1-21 inclusive | Lenalidomide | 25mg | PO | Every 28 days |
| 1,8, 15 and 22 | Dexamethasone | 40mg | PO | Every 28 days |

^aIxazomib should be taken at least 1 hour before or at least 2 hours after food

Delayed or missed doses:
 In the event that an ixazomib dose is delayed or missed, the dose should be taken only if the next scheduled dose is ≥ 72 hours away. A missed dose should not be taken within 72 hours of the next scheduled dose. A double dose should not be taken to make up for a missed dose.
 If a patient vomits after taking a dose, the patient should not repeat the dose but should resume dosing at the time of the next scheduled dose.

ELIGIBILITY:

- Indication as above
- ECOG 0-2
- ANC $> 1 \times 10^9/L$, platelets $> 75 \times 10^9/L$
- CrCl ≥ 30 ml/min

CAUTIONS:

- Pre-existing neuropathy
 - Peripheral neuropathy -Grade 1 with pain or Grade ≥ 2

| <p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. Use of these documents is the responsibility of the prescribing clinician, and is subject to HSE's terms of use available at http://www.hse.ie/eng/Disclaimer This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens</p> | | |

EXCLUSIONS:

- Hypersensitivity to ixazomib, lenalidomide or any of the excipients.
- Pregnancy.
- Breastfeeding
- Women of childbearing potential unless all the conditions of the Revlimid® Pregnancy Prevention Programme are met.

PRESCRIPTIVE AUTHORITY:

The treatment plan must be initiated by a Consultant Haematologist working in the area of haematological malignancies.

TESTS:

Baseline tests:

- FBC, renal, liver and bone profile
- Uric acid
- Blood glucose (patients on oral hypoglycaemics)
- ECG
- Assessment of peripheral neuropathy status
- VTE risk assessment
- Pregnancy test in women of child-bearing age or evidence of a hysterectomy. Assessment and registration as per Pregnancy Prevention Program for both male and female patients.
- Virology screen -Hepatitis B (HBsAg, HBcoreAb)
*(Reference Adverse Events/Regimen Specific Complications for information on Hepatitis B reactivation)

Regular tests:

- Consider FBC, renal, liver and bone profile on day 14 of cycle 1
- FBC, renal and liver profile monthly thereafter
- Blood glucose
- Pregnancy test every 28 days if female of childbearing potential
- Consider monitoring thyroid function tests
- Peripheral neuropathy assessment

Disease monitoring:

Disease monitoring should be in line with the patient's treatment plan and any other test/s as directed by the supervising Consultant

DOSE MODIFICATIONS:

- Any dose modification should be discussed with a Consultant
- Prior to initiating a new cycle of therapy:
 - Absolute neutrophil count should be $\geq 1.0 \times 10^9/L$
 - Platelet count should be $\geq 75 \times 10^9/L$
 - Non-haematologic toxicities should, at the clinician's discretion, generally be recovered to patient's baseline condition or \leq Grade 1

- The dose reduction steps for ixazomib and lenalidomide are outlined in Table 2 and dose modification guidelines are provided in Table 3

Table 2: Dose Level Reduction steps for Ixazomib and Lenalidomide

| | Ixazomib | Lenalidomide |
|----------------------------------|-----------------|---------------------|
| Recommended starting dose | 4mg* | 25mg |
| Dose level -1 | 3mg | 15mg |
| Dose level -2 | 2.3mg | 10mg |
| Dose level- 3 | DISCONTINUE | 5mg |

*Recommended reduced dose of 3 mg in the presence of moderate or severe hepatic impairment, severe renal impairment or end-stage renal disease (ESRD) requiring dialysis.

- An alternating dose modification approach is recommended for ixazomib and lenalidomide for overlapping toxicities of thrombocytopenia, neutropenia and rash.
- For these toxicities, the first dose modification step is to withhold/reduce lenalidomide.

Table 3: Dose modification guidelines for treatment with ixazomib in combination with lenalidomide and dexamethasone

| Haematologic toxicity | Recommended action |
|--|--|
| Platelet count < 30x10⁹/L 1st occurrence 2nd occurrence | Withhold ixazomib and lenalidomide until platelet count ≥ 30x10 ⁹ /L. Following recovery, resume lenalidomide at the next lower dose level and resume ixazomib at its most recent dose. Withhold ixazomib and lenalidomide until platelet count ≥ 30x10 ⁹ /L. Following recovery, resume ixazomib at the next lower dose and resume lenalidomide at its most recent dose.* |
| Absolute neutrophil count < 0.5 x 10⁹ /L 1st occurrence 2nd occurrence | Withhold ixazomib and lenalidomide until ANC is ≥ 0.5 x 10 ⁹ cells/L. Consider adding G-CSF as per clinical guidelines. Following recovery, resume lenalidomide at the next lower dose level and resume ixazomib at its most recent dose. Withhold ixazomib and lenalidomide until ANC is ≥ 0.5 x 10 ⁹ cells/L. Following recovery, resume ixazomib at the next lower dose and resume lenalidomide at its most recent dose.* |
| Non-haematologic toxicity | Recommended action |
| Rash Grade 2 or 3 <ul style="list-style-type: none"> • 1st occurrence • 2nd occurrence Grade 4 | Withhold lenalidomide until rash recovers to ≤ Grade 1. Following recovery, resume lenalidomide at the next lower dose level Withhold ixazomib and lenalidomide until rash recovers to ≤ Grade 1. Following recovery, resume ixazomib at the next lower dose and resume lenalidomide at its most recent dose.* Discontinue treatment regimen |
| Peripheral neuropathy Grade 1 peripheral neuropathy with pain or Grade 2 peripheral neuropathy | Withhold ixazomib until peripheral neuropathy recovers to ≤ Grade 1 without pain or patient's baseline. Following recovery, resume ixazomib at its most recent dose. |
| Grade 2 peripheral neuropathy with pain or Grade 3 peripheral neuropathy | Withhold ixazomib. Toxicities should, at the clinician's discretion, generally recover to patient's baseline condition or ≤ Grade 1 prior to resuming ixazomib. Following recovery, resume ixazomib at the next lower dose. |
| Grade 4 peripheral neuropathy | Discontinue treatment regimen |
| Other Grade 3 or 4 non-haematological toxicities | Withhold ixazomib. Toxicities should, at the clinician's discretion, generally recover to patient's baseline condition or at most Grade 1 prior to resuming ixazomib. If attributable to ixazomib, resume ixazomib at the next lower dose following recovery. |
| *For additional occurrences, alternate dose modification of lenalidomide and ixazomib | |

| | | |

Renal and Hepatic Impairment:

Table 4: Dose modification of ixazomib and lenalidomide based on renal function

| Ixazomib | Creatinine Clearance ml/min | | Dose modification |
|--|--|--|---|
| | ≥ 30 | | |
| | < 30 or end-stage renal disease (ESRD) requiring dialysis. | | Reduce dose to 3mg |
| Ixazomib is not dialyzable and, therefore, can be administered without regard to the timing of dialysis | | | |
| Lenalidomide | Creatinine Clearance ml/min | | Dose modification |
| | 30 to 50 | | |
| | <30 not requiring dialysis | | 15mg every other day |
| | < 30 requiring dialysis | | Reduce dose to 5mg once daily. On dialysis days dose should be administered after dialysis. |
| *The dose may be escalated to 15mg once daily after 2 cycles if patient is not responding to treatment and is tolerating the treatment | | | |

Hepatic impairment:

Table 6: Dose modification of ixazomib and lenalidomide based on hepatic function

| | |
|---------------------|--|
| Ixazomib | <ul style="list-style-type: none"> No dose adjustment of ixazomib is required for patients with mild hepatic impairment (total bilirubin ≤ upper limit of normal (ULN) and aspartate aminotransferase (AST) > ULN or total bilirubin > 1-1.5 x ULN and any AST). The reduced dose of 3 mg is recommended in patients with moderate (total bilirubin > 1.5-3 x ULN) or severe (total bilirubin > 3 x ULN) hepatic impairment. |
| Lenalidomide | <ul style="list-style-type: none"> Lenalidomide has not formally been studied in patients with impaired hepatic function and there are no specific dose recommendations |

SUPPORTIVE CARE:

EMETOGENIC POTENTIAL: Minimal (**Refer to local policy**).

PRE-MEDICATIONS: None usually required

OTHER SUPPORTIVE CARE:

- Antiviral prophylaxis should be prescribed in patients being treated with ixazomib as it has been shown to decrease the risk of herpes zoster reactivation in patients treated with proteasome inhibitors (**Refer to local policy**)
- Tumour Lysis Syndrome (TLS) prophylaxis (**Refer to local policy**)
- Thromboprophylaxis (**Refer to local policy**)
- Prophylactic laxatives to prevent lenalidomide-induced constipation (**Refer to local policy**).
- Bisphosphonates should be considered in all patients with myeloma-related bone disease.
- Consider the use of a H₂ antagonist or proton pump inhibitor if appropriate in patients receiving dexamethasone therapy (**Refer to local policy**).

ADVERSE EFFECTS / REGIMEN SPECIFIC COMPLICATIONS

The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details.

Ixazomib is subject to additional monitoring. Healthcare professionals are asked to report any suspected adverse reactions.

Ixazomib

- **Thrombocytopenia:** Thrombocytopenia has been reported with ixazomib with platelet nadirs typically occurring between Days 14-21 of each 28-day cycle and recovery to baseline by the start of the next cycle. Platelet counts should be monitored at least monthly during ixazomib treatment. More frequent monitoring should be considered during the first three cycles as per the lenalidomide SmPC. Thrombocytopenia can be managed with dose modifications and platelet transfusions as per standard medical guidelines.
- **Gastrointestinal toxicities** Diarrhoea, constipation, nausea and vomiting have been reported with ixazomib, occasionally requiring use of antiemetic and antidiarrhoeal medicinal products and supportive care). The dose should be adjusted for severe (Grade 3-4) symptoms. In case of severe gastrointestinal events, monitoring of serum potassium level is recommended.
- **Peripheral neuropathy:** Peripheral neuropathy has been reported with ixazomib. The patient should be monitored for symptoms of peripheral neuropathy. Patients experiencing new or worsening peripheral neuropathy may require dose modification.
- **Peripheral oedema:** Peripheral oedema has been reported with ixazomib. The patient should be evaluated for underlying causes and provide supportive care, as necessary. The dose of dexamethasone should be adjusted per its prescribing information or ixazomib for Grade 3 or 4 symptoms.
- **Cutaneous reactions:** Rash has been reported with ixazomib and should be managed with supportive care or with dose modification if Grade 2 or higher.
- **Hepatotoxicity:** Drug-induced liver injury, hepatocellular injury, hepatic steatosis, hepatitis cholestatic and hepatotoxicity have been uncommonly reported with ixazomib. Hepatic enzymes should be monitored regularly and the dose should be adjusted for Grade 3 or 4 symptoms.
- **Pregnancy:** Women should avoid becoming pregnant while being treated with ixazomib. If ixazomib is used during pregnancy or if the patient becomes pregnant while taking ixazomib, the patient should be apprised of the potential hazard to the foetus. Women of childbearing potential must use highly effective contraception while taking ixazomib and for 90 days after stopping treatment. Women using hormonal contraceptives should additionally use a barrier method of contraception.
- **Posterior reversible encephalopathy syndrome:** Posterior reversible encephalopathy syndrome (PRES) has occurred in patients receiving ixazomib. PRES is a rare, reversible, neurological disorder which can present with seizure, hypertension, headache, altered consciousness, and visual disturbances. Brain imaging, preferably Magnetic Resonance Imaging, is used to confirm the diagnosis. In patients developing PRES, discontinue ixazomib
- **Concomitant use of strong CYP3A inducers:** Strong inducers may reduce the efficacy of ixazomib, therefore the concomitant use of strong CYP3A inducers during therapy with ixazomib should be avoided. Closely monitor patients for disease control if co-administration with a strong CYP3A inducer cannot be avoided
- **Hepatitis B Reactivation:** Patients should be tested for both HBsAg and HBcoreAb as per local policy. If either test is positive, such patients may require prophylactic treatment (e.g. lamivudine) to prevent reactivation of Hepatitis B for the entire duration of chemotherapy and for six months afterwards (Refer to local policy). Such patients should also be monitored with frequent liver function tests and hepatitis B virus DNA at least every two months. If the hepatitis B virus DNA level rises during this monitoring, management should be reviewed with an appropriate specialist with experience managing hepatitis and

consideration given to stopping chemotherapy

Lenalidomide

- **Teratogenic effects:** Lenalidomide is structurally related to thalidomide a powerful human teratogen. It must never be used by women who are pregnant or by women who could become pregnant unless all the conditions of the Revlimid® Pregnancy Prevention Programme are met.
- **Skin reactions:** Lenalidomide must be discontinued permanently for exfoliative or bullous rash or if Stevens-Johnson syndrome (SJS) or toxic epidermal necrolysis (TEN) is suspected.
- **Cardiovascular:** Patients with known risk factors for MI, including prior thrombosis should be closely monitored and action should be taken to try to minimise all modifiable risk factors (e.g. smoking, hypertension and hyperlipidaemia). There is an increased risk of venous and arterial thromboembolism in patients treated with lenalidomide and dexamethasone. Previous history of thromboembolic events or concomitant administration of erythropoietic agents or other agents such as hormone replacement therapy, may also increase thromboembolic risk in these patients. Particularly, a haemoglobin concentration above 12g/dl should lead to discontinuation of erythropoietic agents. Thromboprophylaxis should be considered especially in patients with additional thrombotic risk factors.
- **Peripheral Neuropathy:** Lenalidomide is structurally related to thalidomide which is known to induce severe peripheral neuropathy. The neurotoxic potential of lenalidomide associated with long-term use cannot be ruled out.
- **Thyroid function:** Cases of hypothyroidism have been reported and baseline and ongoing monitoring of thyroid function is recommended.
- **Tumour lysis syndrome:** Patients at risk of tumour lysis syndrome are those with high tumour burden prior to treatment. These patients should be monitored closely and appropriate precautions taken.

DRUG INTERACTIONS:

- Strong CYP3A inducers may reduce the efficacy of ixazomib; therefore the concomitant use of strong CYP3A inducers should be avoided.
- Erythropoietic agents, or other agents that may increase the risk of thrombosis, such as hormone replacement therapy, should be used with caution multiple myeloma patients receiving lenalidomide with dexamethasone.
- There is an increased risk of rhabdomyolysis when statins are administered with lenalidomide, which may be simply additive. Enhanced clinical and laboratory monitoring is warranted notably during the first weeks of treatment.
- Oral contraceptives: When ixazomib is administered together with dexamethasone, which is known to be a weak to moderate inducer of CYP3A4 as well as other enzymes and transporters, the risk for reduced efficacy of oral contraceptives needs to be considered. Women using hormonal contraceptives should additionally use a barrier method of contraception.
- Current drug interaction databases should be consulted for more information.

ATC CODE:

Ixazomib -L01XX50
Lenalidomide - L04AX04
